## OUR MAIN TOPICS TODAY

Understanding through a example

Basic git and github defination

Common terminal codes

Live demo

join our community via link:- <https://t.me/ccodelikepro>

Suppose you want to cook a dish  
After a lot of trial and error you  
finally made first version of your dish

And what if you have a team  
And everyone want to taste your  
each version of your dish and want  
improvise your dish by adding  
ingredients to your master piece

You want to improvise your dish  
So you add few more ingredients  
and makes second version of your  
dish.

You are still not satisfied so you  
made third version of your dish

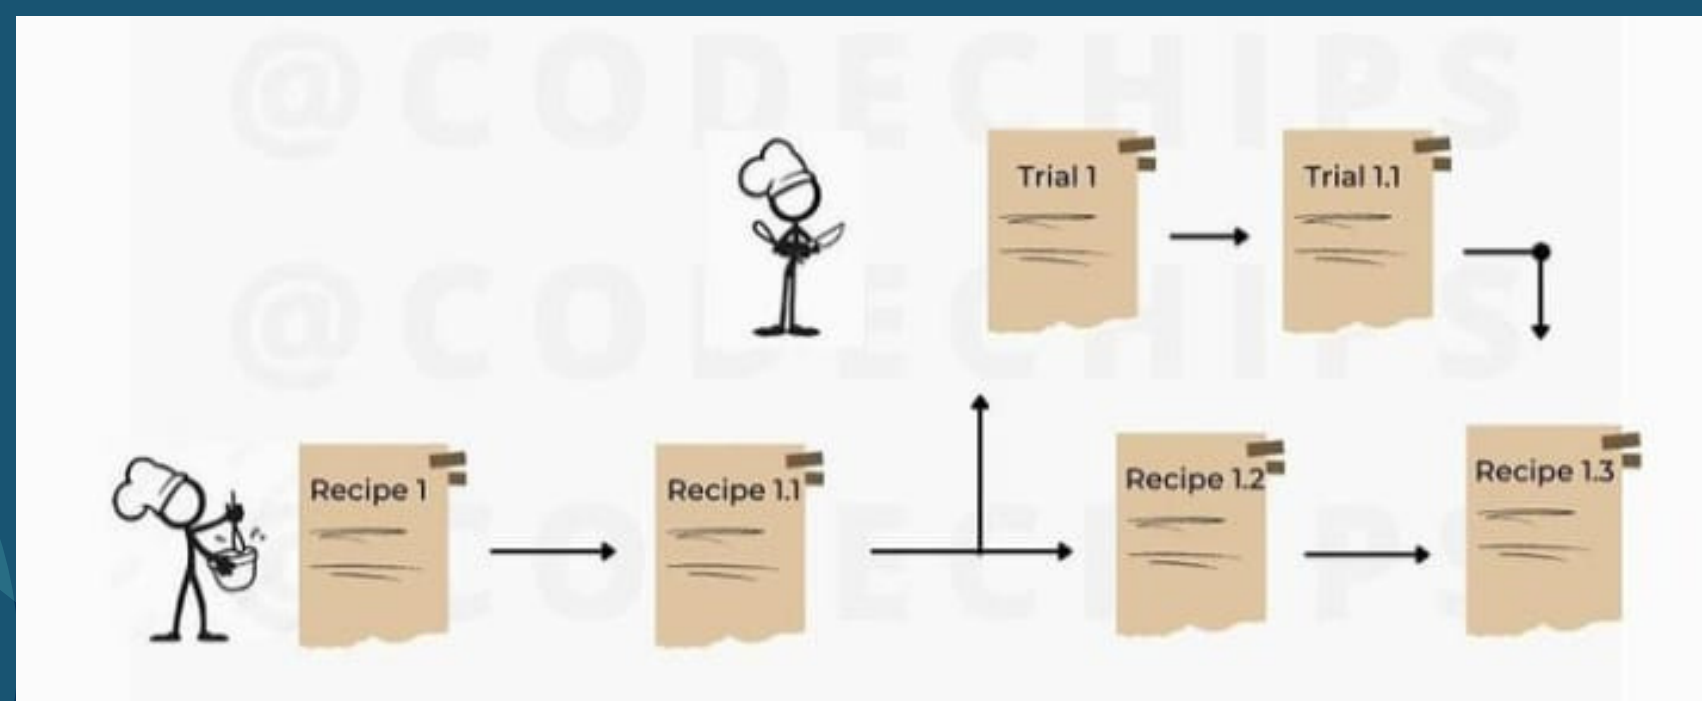

And now you notices everything is  
messed up  
Wouldn't it be great if you have a  
time machine to go back to your  
previous version if something goes  
wrong.

# git

## SO HOW THIS EXAMPLE RELATES WITH GIT

So git is a distributed version control system which tracks the changes that you made, so you have a record of what have been done and you can revert back to the older version whenever you want.

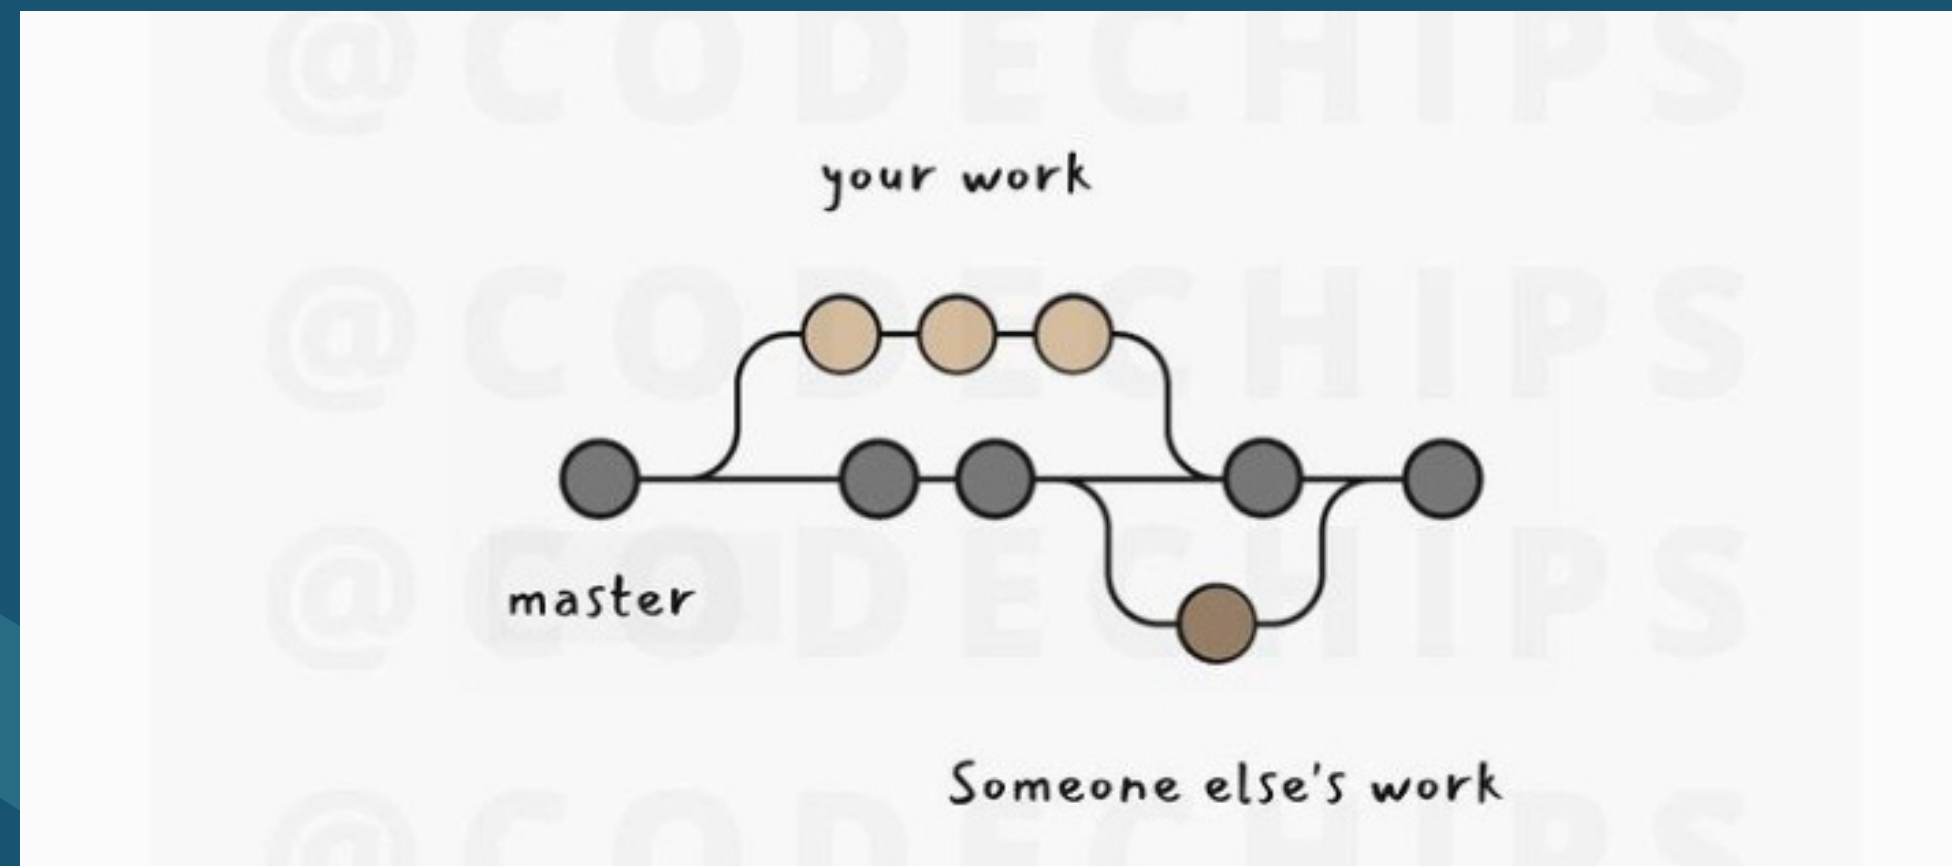

## BEFORE GIT AND GITHUB

Before git and github programmers use to keep their all different versions in separate folders which is not an efficient and manageable method.

join our community via link:- <https://t.me/ccodelikepro>

Git can automatically merge the changes, so two people can work on different parts of the same file and later merge those changes without losing each others work.

## CONFIGURING CODE

```
git config --global user.name "your username"  
git config --global user.email "your email"
```

## ADDING THE CODE TO STAGING

```
git add .
```

## FINALLY PUSHING THE CODE

```
git push
```

## CLONING A REPOSITORY

```
git clone "link your repository"
```

## ADDING MESSAGE

```
git commit -m "any message"
```

## TO CHECK THE STATUS

```
git status
```

## GITHUB

GitHub is a web-based version-control and collaboration platform for software developers. Microsoft, the biggest single contributor to GitHub, initiated an acquisition of GitHub for \$7.5 billion in June, 2018. GitHub, which is delivered through a software-as-a-service (SaaS) business model, was started in 2008 and was founded on Git, an open source code management system created by Linus Torvalds to make software builds faster.

Git is used to store the source code for a project and track the complete history of all changes to that code. It allows developers to collaborate on a project more effectively by providing tools for managing possibly conflicting changes from multiple developers.
